# Lattices

A lattice  $\mathcal{L} = \mathcal{L}(B)$  is specified by a basis

$B = (b_1, b_2, \dots, b_n)$  of linearly independent vectors  $b_i \in \mathbb{R}^d$ :

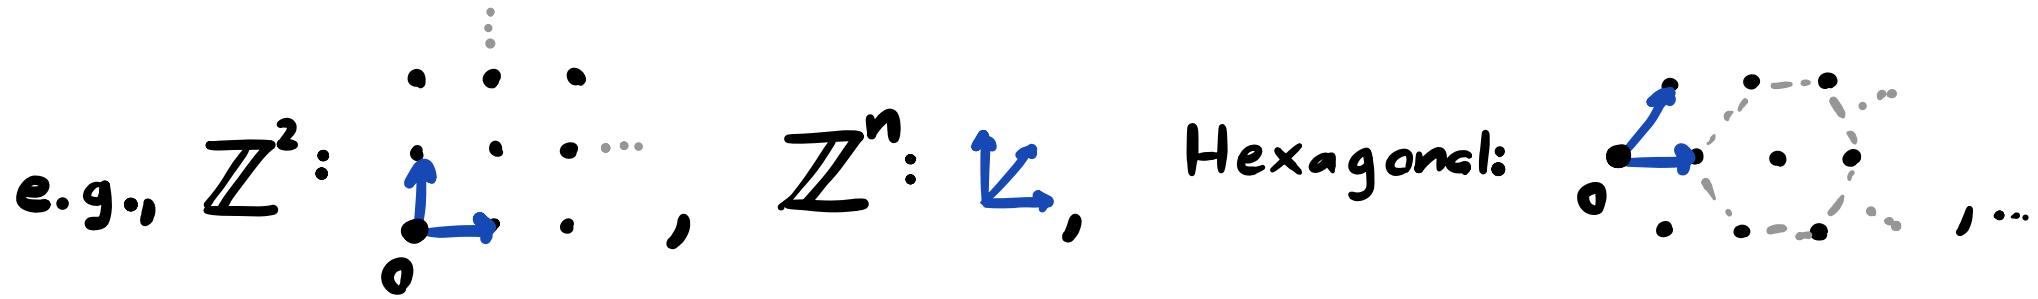

$$\mathcal{L}(B) := \left\{ z_1 b_1 + z_2 b_2 + \dots + z_n b_n \mid z_i \in \mathbb{Z} \right\}$$

# Lattices

A lattice  $\mathcal{L} = \mathcal{L}(B)$  is specified by a basis

$B = (b_1, b_2, \dots, b_n)$  of linearly independent vectors  $b_i \in \mathbb{R}^d$ :

$$\mathcal{L}(B) := \left\{ z_1 b_1 + z_2 b_2 + \dots + z_n b_n \mid z_i \in \mathbb{Z} \right\}$$

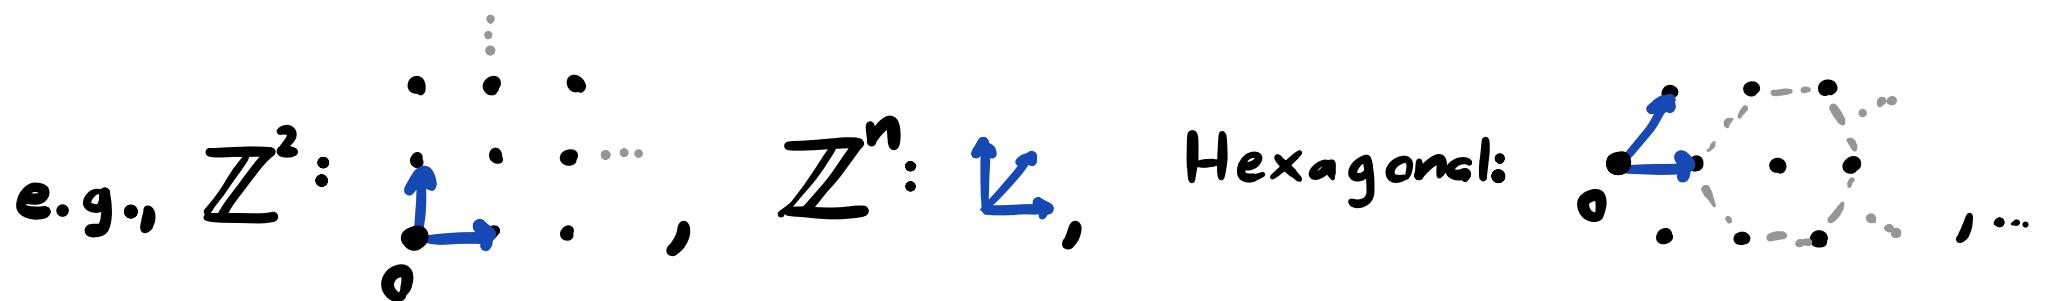

# Lattices

A lattice  $\mathcal{L} = \mathcal{L}(B)$  is specified by a basis

$B = (b_1, b_2, \dots, b_n)$  of linearly independent vectors  $b_i \in \mathbb{R}^d$ :

$$\mathcal{L}(B) := \left\{ z_1 b_1 + z_2 b_2 + \dots + z_n b_n \mid z_i \in \mathbb{Z} \right\}$$

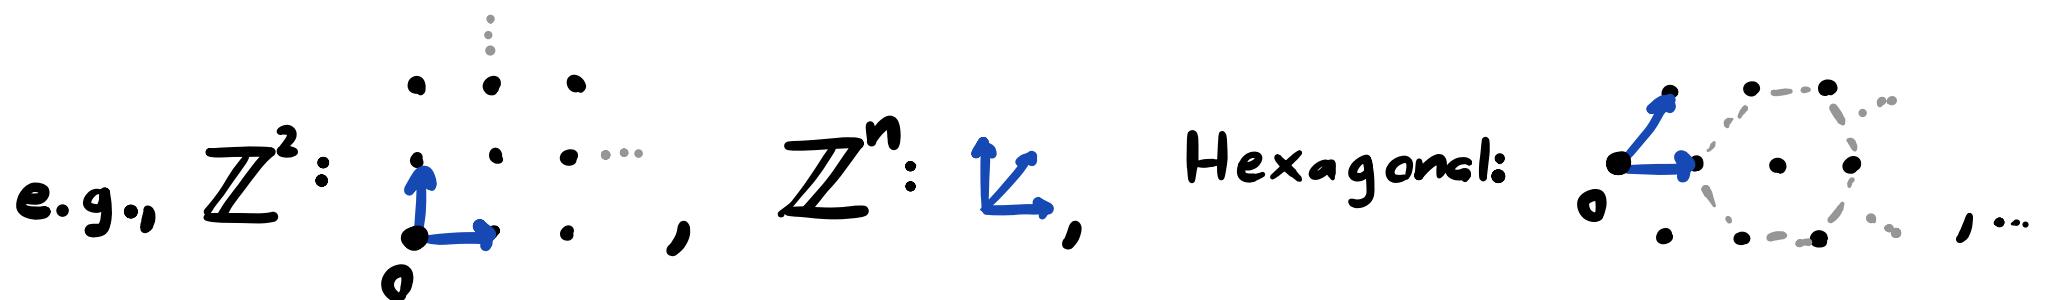

# Lattices

A lattice  $\mathcal{L} = \mathcal{L}(B)$  is specified by a basis

$B = (b_1, b_2, \dots, b_n)$  of linearly independent vectors  $b_i \in \mathbb{R}^d$ :

$$\mathcal{L}(B) := \left\{ z_1 b_1 + z_2 b_2 + \dots + z_n b_n \mid z_i \in \mathbb{Z} \right\}$$

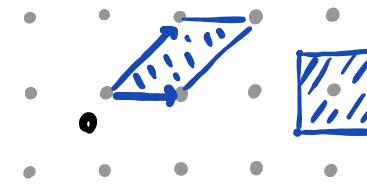

$n$  is called the rank or dimension of  $\mathcal{L}$ .

# Lattices

$$\lambda_1(\mathcal{L}) := \min_{\substack{y \in \mathcal{L} \\ y \neq \vec{0}}} \|y\|$$

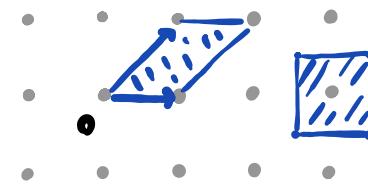

# Lattices

$$\lambda_1(\mathcal{L}) := \min_{\substack{y \in \mathcal{L} \\ y \neq \vec{0}}} \|y\|$$

$$\begin{aligned}\det(\mathcal{L}) &:= \sqrt{\det(B^T B)} \\ &= \frac{\text{volume}}{\text{paint}} = \frac{1}{\text{density}}.\end{aligned}$$

# Lattices

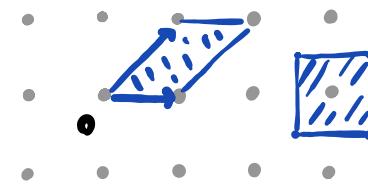

$$\lambda_1(\mathcal{L}) := \min_{\substack{y \in \mathcal{L} \\ y \neq \vec{0}}} \|y\|$$

$$\begin{aligned}\det(\mathcal{L}) &:= \sqrt{\det(B^T B)} \\ &= \frac{\text{volume}}{\text{paint}} = \frac{1}{\text{density}}.\end{aligned}$$

$$\lambda_1(\mathcal{L}) \leq \sqrt{n} \det(\mathcal{L})^{1/n}$$

# Lattices

$$\lambda_1(\mathcal{L}) := \min_{\substack{y \in \mathcal{L} \\ y \neq \vec{0}}} \|y\|$$

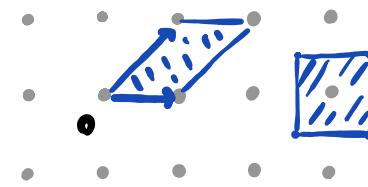

$$\begin{aligned}\det(\mathcal{L}) &:= \sqrt{\det(B^T B)} \\ &= \frac{\text{volume}}{\text{point}} = \frac{1}{\text{density}}.\end{aligned}$$

$$\lambda_1(\mathcal{L}) \leq \sqrt{n} \det(\mathcal{L})^{1/n}$$

SVP: Find  $v \in \mathcal{L}$  with  $\|v\| = \lambda_1(\mathcal{L})$ .

# Lattices

$$\lambda_1(\mathcal{L}) := \min_{\substack{y \in \mathcal{L} \\ y \neq \vec{0}}} \|y\|$$

$$\begin{aligned}\det(\mathcal{L}) &:= \sqrt{\det(B^T B)} \\ &= \frac{\text{volume}}{\text{paint}} = \frac{1}{\text{density}}.\end{aligned}$$

$$\lambda_1(\mathcal{L}) \leq \sqrt{n} \det(\mathcal{L})^{1/n}$$

SVP: Find  $v \in \mathcal{L}$  with  $\|v\| = \lambda_1(\mathcal{L})$ .

$\gamma$ -approximate (H)SVP: Find  $v \in \mathcal{L}$ :

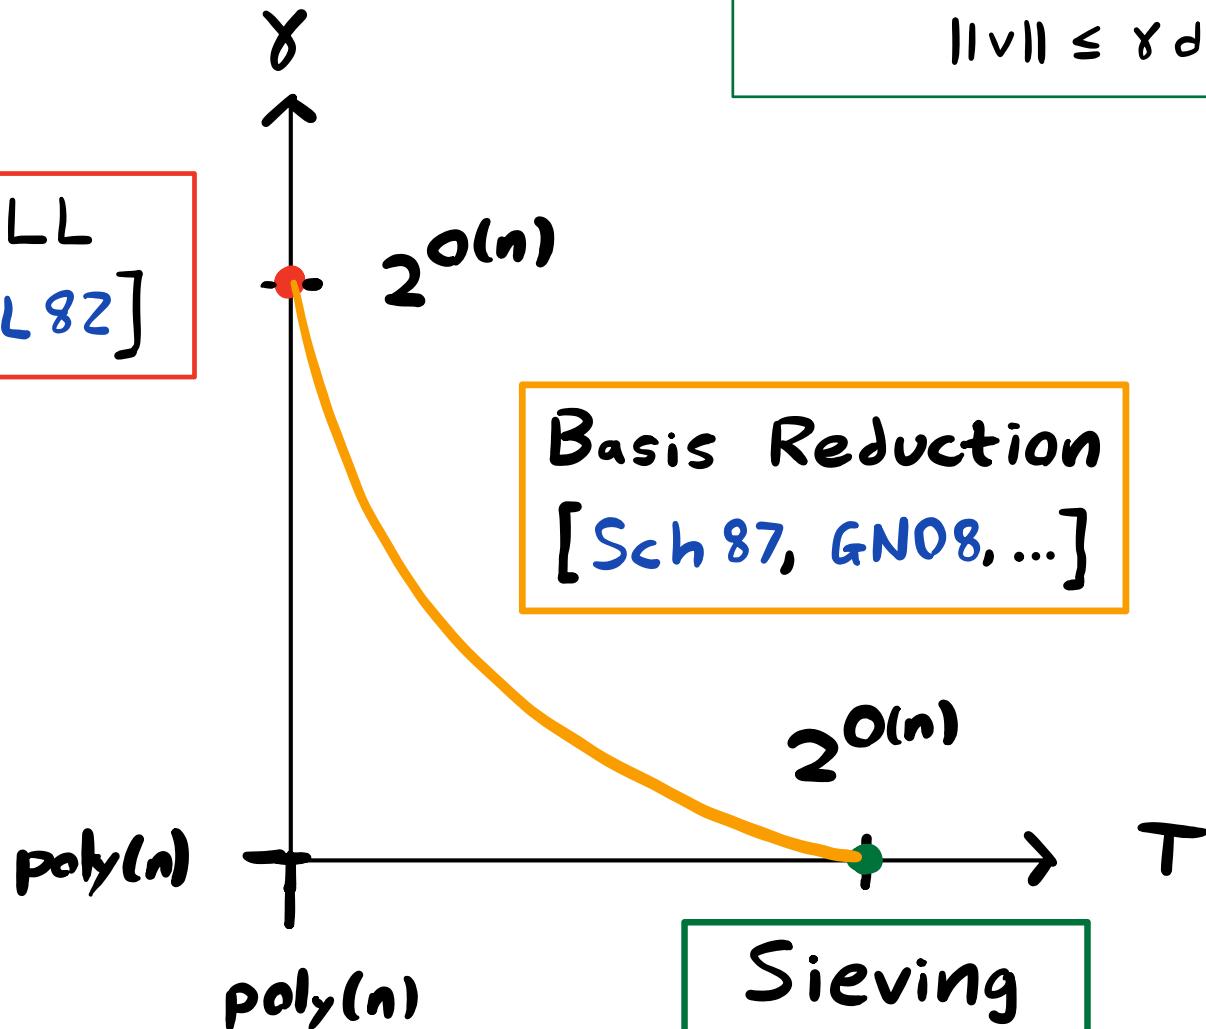

$$\|v\| \leq \gamma \det(\mathcal{L})^{1/n}$$

# Time / Approximation Tradeoffs

$\gamma$ -approximate (H)SVP: Find  $v \in \mathbb{Z}^n$ :

$$\|v\| \leq \gamma \det(\mathcal{L})^{1/n}$$

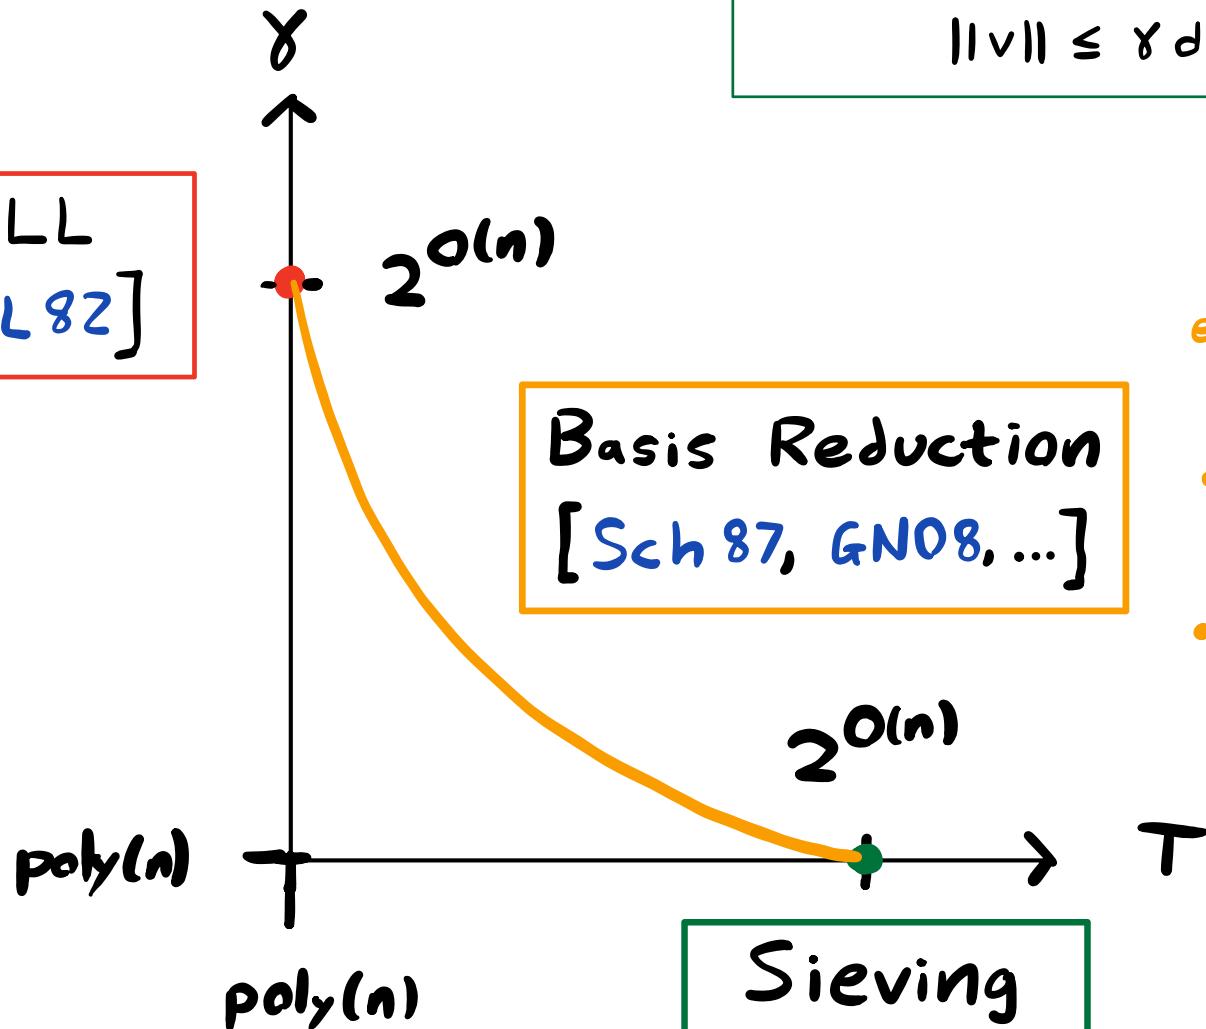

LLL

  - "Recurse on a smaller-dimensional lattice!"
  - Should be a sublattice

# Basis Reduction Algorithms

- All basis reduction algorithms follow the basic approach of LLL: iteratively improve the basis by solving SVP exactly in smaller dimension.
- Analysis is intricate
  - Our best (practical) algorithms are heuristic
- This talk: match Basis Reduction tradeoff with an "Algorithms 101"-style recursive algorithm.
  - "Recurse on a smaller-dimensional lattice!"
  - Should be a sublattice
  - But should still have short vectors — i.e., small determinant.

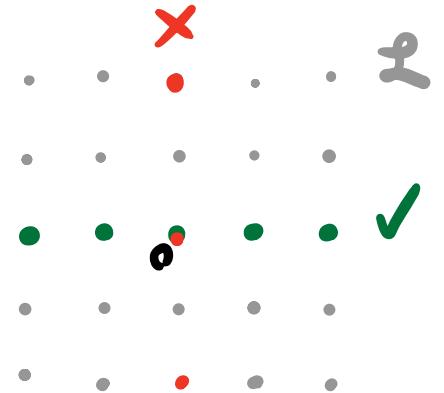

# The Densest Sublattice Problem

A sublattice  $\mathbb{L}'$  of  $\mathbb{L}$  is the intersection of  $\mathbb{L}$  with a subspace.

# The Densest Sublattice Problem

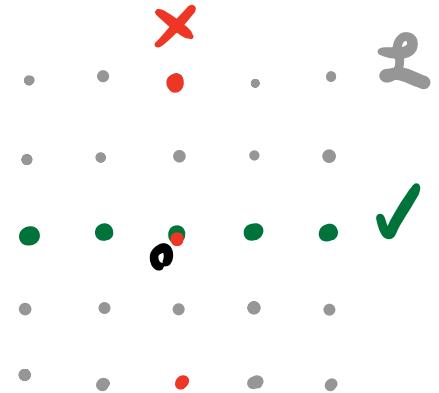

A sublattice  $\mathbb{L}'$  of  $\mathbb{L}$  is the intersection of  $\mathbb{L}$  with a subspace.

$\gamma$ -DSP<sub>l</sub>( $\mathbb{L}$ ): Find  $\mathbb{L}' \subset \mathbb{L}$  of rank l such that  $\det(\mathbb{L}') \leq \gamma \cdot \det(\mathbb{L})^{l/n}$ .

# The Densest Sublattice Problem

A sublattice  $\mathbb{L}'$  of  $\mathbb{L}$  is the intersection of  $\mathbb{L}$  with a subspace.

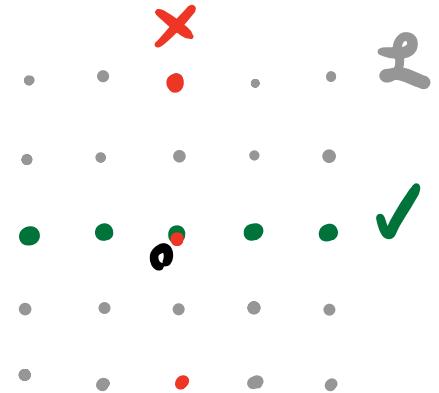

$\gamma$ -DSP $_l(\mathbb{L})$ : Find  $\mathbb{L}' \subset \mathbb{L}$  of rank  $l$   
such that  $\det(\mathbb{L}') \leq \gamma \cdot \det(\mathbb{L})^{l/n}$ .

$$\gamma(\mathbb{L}', \mathbb{L}) := \frac{\det(\mathbb{L}')}{\det(\mathbb{L})^{l/n}}$$

$\sqrt{\delta_{n,l}}$  is the best  $\gamma$  possible  
in general (for worst-case  $\mathbb{L}$ )

# The Densest Sublattice Problem

A sublattice  $\mathcal{L}'$  of  $\mathcal{L}$  is the intersection of  $\mathcal{L}$  with a subspace.

$\gamma$ -DSP $_{\ell}(\mathcal{L})$ : Find  $\mathcal{L}' \subset \mathcal{L}$  of rank  $\ell$   
such that  $\det(\mathcal{L}') \leq \gamma \cdot \det(\mathcal{L})^{\ell/n}$ .

$$\gamma(\mathcal{L}', \mathcal{L}) := \frac{\det(\mathcal{L}')}{\det(\mathcal{L})^{\ell/n}}$$

$\sqrt{\delta_n, \ell}$  is the best  $\gamma$  possible  
in general (for worst-case  $\mathcal{L}$ )

$\gamma$ -DSP with  $\ell=1$  is exactly  $\gamma$ -SVP.

# An approach for solving SVP

$A(\mathcal{L})$ :

1. Find dense sublattice  $\mathcal{L}' \subset \mathcal{L}$   
(somehow)
2. Return  $A(\mathcal{L}')$ .

- For the base case, when  $\text{rank}(\mathcal{L}) = k$ ,  
output  $\text{SVP}(\mathcal{L})$  — that is, use an exact algorithm.

$\gamma$ -DSP is Composable

Consider  $\mathfrak{L}'' \subset \mathfrak{L}' \subset \mathfrak{L}$ .

rank:  $l < m < n$

$\gamma$ -DSP is Composable

Consider  $\mathfrak{L}'' \subset \mathfrak{L}' \subset \mathfrak{L}$ .

rank:  $l < m < n$

$\mathfrak{L}'' \in \gamma_1\text{-DSP}_l(\mathfrak{L}')$  AND  $\mathfrak{L}' \in \gamma_2\text{-DSP}_m(\mathfrak{L})$

# $\gamma$ -DSP is Composable

Consider  $\mathfrak{L}'' \subset \mathfrak{L}' \subset \mathfrak{L}$ .

rank:  $l < m < n$

$\mathfrak{L}'' \in \gamma_1\text{-DSP}_l(\mathfrak{L}')$  AND  $\mathfrak{L}' \in \gamma_2\text{-DSP}_m(\mathfrak{L})$

$\Rightarrow \mathfrak{L}'' \in (\gamma_1 \cdot \gamma_2^{l/m})\text{-DSP}_l(\mathfrak{L})$

# $\gamma$ -DSP is Composable

Consider  $\mathfrak{L}'' \subset \mathfrak{L}' \subset \mathfrak{L}$ .

rank:  $l < m < n$

$\mathfrak{L}'' \in \gamma_1\text{-DSP}_l(\mathfrak{L}')$  AND  $\mathfrak{L}' \in \gamma_2\text{-DSP}_m(\mathfrak{L})$

$\Rightarrow \mathfrak{L}'' \in (\gamma_1 \cdot \gamma_2^{l/m})\text{-DSP}_l(\mathfrak{L})$

Proof.  $\det(\mathfrak{L}'') \leq \gamma_1 \cdot \det(\mathfrak{L}')^{l/m}$

$$= \gamma_1 \cdot (\gamma_2 \det(\mathfrak{L})^{l/m})^{m/n} = \gamma_1 \cdot \gamma_2^{l/m} \det(\mathfrak{L})^{l/m}.$$

# $\gamma$ -DSP is Self-Dual

$$\mathcal{L}^* := \{ w \in \text{spcn}(\mathcal{L}) : \forall y \in \mathcal{L}, \langle w, y \rangle \in \mathbb{Z} \}$$

$$(\mathcal{L}^*)^* = \mathcal{L}$$

$$\det(\mathcal{L}^*) = 1 / \det(\mathcal{L})$$

- There is a bijection from rank  $\ell$  sublattices of  $\mathcal{L}$  to rank  $(n-\ell)$  sublattices of  $\mathcal{L}^*$ , preserving the approximation factor!

$$\mathcal{L}' \in \gamma\text{-DSP}_\ell(\mathcal{L})$$

$$\iff$$

$$\mathcal{L}^* \cap (\mathcal{L}')^\perp \in \gamma\text{-DSP}_{n-\ell}(\mathcal{L}^*)$$

Important Special Case:

$$w \in \gamma\text{-SVP}(\mathcal{L}^*)$$

$$\iff$$

$$\mathcal{L} \cap w^\perp \in \gamma\text{-DSP}_{n-1}(\mathcal{L}).$$

$\gamma$ -DSP is Self-Dual

$$\mathcal{L}^* := \{ w \in \text{spcn}(\mathcal{L}) : \forall y \in \mathcal{L}, \langle w, y \rangle \in \mathbb{Z} \}$$

$\gamma$ -DSP is Self-Dual

$$\iff$$

$$\mathcal{L}^* \cap (\mathcal{L}')^\perp \in \gamma\text{-DSP}_{n-\ell}(\mathcal{L}^*)$$

Important Special Case:

$$w \in \gamma\text{-SVP}(\mathcal{L}^*)$$

$$\iff$$

$$\mathcal{L} \cap w^\perp \in \gamma\text{-DSP}_{n-1}(\mathcal{L}).$$

Warm-up:  $\ell = 1$  ( $SVP \Rightarrow SVP$ )

- Plan:

1.  $w \leftarrow A(\mathcal{L}^*)$
2.  $\mathcal{L}' := \mathcal{L} \cap w^\perp$
3. Output  $A(\mathcal{L}')$ .

- Base case: if  $\text{rank}(\mathcal{L}) = k$ , output  $SVP(\mathcal{L})$ .

Warm-up:  $\ell = 1$  ( $SVP \Rightarrow SVP$ )

- Plan:

$$1. w \leftarrow A(\mathcal{L}^*)$$

$$1. w \leftarrow A(\mathcal{L})$$

$$1. w \leftarrow A(\mathcal{L}^*)$$

...

Warm-up:  $\ell = 1$  ( $SVP \Rightarrow SVP$ )

- Plan:

- Choose initial "depth parameter"

$$\tau = \tau(n) \geq 0.$$

$$1. w \leftarrow A(\mathcal{L}^*, \tau - 1)$$

$$2. \mathcal{L}' := \mathcal{L} \cap w^\perp$$

$$3. \text{Output } A(\mathcal{L}'; \tau)$$

- Base cases:

if  $\tau = 0$ , output  $LLL(\mathcal{L}, 1)$

if  $\text{rank}(\mathcal{L}) = K$ , output  $SVP(\mathcal{L})$ .

# Analysis

1.  $\omega \leftarrow A(\mathfrak{L}^*, \tau - 1)$
2.  $\mathfrak{L}' := \mathfrak{L} \cap \omega^\perp$  (Dual)
3. Output  $A(\mathfrak{L}'; \tau)$  (Composition)

# Analysis

$$1. \omega \leftarrow A(\mathcal{L}^*, \tau - 1)$$

$$2. \mathcal{L}' := \mathcal{L} \cap \omega^\perp \quad (\text{Dual})$$

$$3. \text{Output } A(\mathcal{L}'; \tau) \quad (\text{Composition})$$

$$\gamma(n, \tau) \leq \gamma(y, \mathcal{L}') \cdot \gamma(\mathcal{L}', \mathcal{L})^{\frac{1}{n-1}} \quad (\text{Compositionality})$$

$\mathcal{L} = \mathcal{L}', m = n - 1$

# Analysis

1.  $\omega \leftarrow A(\mathcal{L}^*, \tau - 1)$

2.  $\mathcal{L}' := \mathcal{L} \cap \omega^\perp$  (Dual)

3. Output  $A(\mathcal{L}', \tau)$  (Composition)

$$\gamma(n, \tau) \leq \gamma(y, \mathcal{L}') \cdot \gamma(\mathcal{L}', \mathcal{L})^{\frac{1}{n-1}} \quad (\text{Compositionality})$$

$\mathcal{L} = \mathcal{L}', m = n-1$

$$= \gamma(y, \mathcal{L}') \cdot \gamma(w, \mathcal{L}^*)^{\frac{1}{n-1}} \quad (\text{Duality})$$

# Analysis

1.  $\omega \leftarrow A(\mathcal{L}^*, \tau - 1)$

2.  $\mathcal{L}' := \mathcal{L} \cap \omega^\perp$  (Dual)

3. Output  $A(\mathcal{L}'; \tau)$  (Composition)

$$\gamma(n, \tau) \leq \gamma(y, \mathcal{L}') \cdot \gamma(\mathcal{L}', \mathcal{L})^{\frac{1}{n-1}} \quad (\text{Compositionality})$$

$\mathcal{L} = \mathcal{L}', m = n-1$

$$= \gamma(y, \mathcal{L}') \cdot \gamma(w, \mathcal{L}^*)^{\frac{1}{n-1}} \quad (\text{Duality})$$

$$= \gamma(n-1, \tau) \cdot \gamma(n, \tau-1)^{\frac{1}{n-1}}. \quad (\text{By definition})$$

# Analysis

$$\gamma(n, \tau) \leq \gamma(n-1, \tau) \cdot \gamma(n, \tau-1)^{\frac{1}{n-1}}$$

$$\gamma(n, 0) = 2^n$$

$$\gamma(\kappa, \tau) = \sqrt{\kappa}$$

- Can check that by induction

$$\gamma(n, \tau) \leq \kappa^{\frac{n-1}{2(\kappa-1)}} \cdot \exp(n^3/2^\tau)$$

- Taking  $\tau = O(\log n)$  recovers block reduction:

$$\gamma = (1 + o(1)) \kappa^{\frac{n-1}{2(\kappa-1)}}$$

# Analysis

- SVP oracle calls dominate runtime.

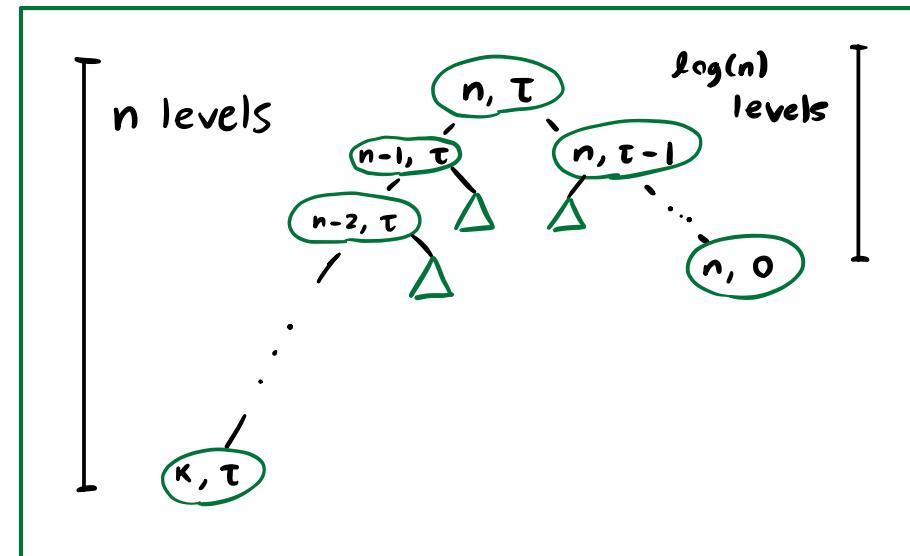

$$C(n, \tau) = C(n-1, \tau) + C(n, \tau-1)$$

$$C(\kappa, \tau) = 1$$

$$C(n, 0) = 0$$

$$C(n, \tau) = \binom{n - \kappa + \tau - 1}{\tau} \approx n^\tau = n^{O(\log n)}$$

- Issue: Call tree highly unbalanced.

Take Two:  $\ell > 1$  ( $DSP \Rightarrow DSP$ )

- Plan:

- Choose initial  $\tau = O(\log n)$ ,  $0 < \varepsilon < 1$ .

$$1. \hat{\mathcal{L}} \leftarrow A(\mathcal{L}^*, \varepsilon n, \tau - 1)$$

$$2. \mathcal{L}' := \mathcal{L} \cap (\hat{\mathcal{L}})^\perp \quad // \text{rank}(\mathcal{L}') = (1-\varepsilon)n$$

$$3. \text{Output } A(\mathcal{L}', \ell, \tau)$$

- Base cases:

if  $\tau = 0$ , output  $LLL(\mathcal{L}, \ell)$

if  $\text{rank}(\mathcal{L}) = \kappa$ , output  $DSP(\mathcal{L}, \ell)$ .

Take Two:  $\ell > 1$  ( $DSP \Rightarrow DsP$ )

- Plan:

- Choose initial  $\tau = O(\log n)$ ,  $0 < \varepsilon \ll 1$ .

$$1. \hat{\mathcal{L}} \leftarrow A(\mathcal{L}^*, \varepsilon n, \tau - 1)$$

$$2. \mathcal{L}' := \mathcal{L} \cap (\hat{\mathcal{L}})^\perp \quad // \text{rank}(\mathcal{L}') = (1-\varepsilon)n$$

$$3. \text{Output } A(\mathcal{L}', \ell, \tau)$$

What if  $\text{rank}(\mathcal{L}') = (1-\varepsilon)n < \ell$ ?

Can't find a larger-rank sublattice!

Take Two:  $\ell > 1$  ( $DSP \Rightarrow DSP$ )

- Plan:

- Choose initial  $\tau = O(\log n)$ ,  $0 < \varepsilon \ll 1$ .

0. If  $\ell > n/2$ ,  
output  $\mathcal{L} \cap (A(\mathcal{L}^*, n-\ell, \tau))^\perp$ .
1.  $\hat{\mathcal{L}} \leftarrow A(\mathcal{L}^*, \lceil \varepsilon n \rceil, \tau-1)$
2.  $\mathcal{L}' := \mathcal{L} \cap (\hat{\mathcal{L}})^\perp$  //  $\text{rank}(\mathcal{L}') = (1-\varepsilon)n$
3. Output  $A(\mathcal{L}', \ell, \tau)$

- Base cases:

if  $\tau=0$ , output  $LLL(\mathcal{L}, \ell)$ .

if  $\text{rank}(\mathcal{L}) = \kappa$ , output  $DSP(\mathcal{L}, \ell)$ .

# Challenges

- The big challenge: make sure that

$$n = k \Rightarrow l = 1 \quad (\text{or } l = n - 1)$$

# Challenges

- The big challenge: make sure that

$$n = k \Rightarrow l = 1 \quad (\text{or } l = n - 1)$$

- Solution idea: maintain the invariant that

$$\hat{l} := \min \{l, n - l\} \leq n - k + 1$$

- Squeeze  $l$  to the extremes!

# Challenges

- The big challenge: make sure that

$$n = k \Rightarrow l = 1 \quad (\text{or } l = n - 1)$$

- Solution idea: maintain the invariant that

$$\hat{l} := \min \{l, n-l\} \leq n - k + 1$$

- Squeeze  $l$  to the extremes!
- Problem: Recurrence not favorable when  $l$  is large.

# Challenges

- The big challenge: make sure that

$$n = k \Rightarrow l = 1 \quad (\text{or } l = n - 1)$$

- Solution idea: maintain the invariant that

$$\hat{l} := \min \{l, n-l\} \leq n - k + 1$$

- Squeeze  $l$  to the extremes!
- Problem: Recurrence not favorable when  $l$  is large.
- Solution idea: When  $l$  is large, be patient:  
don't reduce the depth parameter  $\tau$ .

# The Reduction

Start with  $\ell \leq n - K + 1$ .

- Duality: if  $\max\{1, \frac{(n-K)}{5}\} < \ell < \frac{n}{2}$   
OR  $\ell \geq n - \max\{1, \frac{(n-K)}{10}\}$ :  
Output  $\mathcal{L} \cap A(\mathcal{L}^*, n-\ell, \tau)^\perp$
- Recursive step:  
 $\hat{\mathcal{L}} \leftarrow A(\mathcal{L}^*, \lceil \frac{(n-K)}{20} \rceil, \tau - b)$        $b = \begin{cases} 1, & \ell > \frac{n}{2} \\ 0, & \ell \leq \frac{n}{2} \end{cases}$   
Output  $A(\mathcal{L} \cap (\hat{\mathcal{L}})^\perp, \ell, \tau)$ .
- Base cases:
  - if  $\tau = 0$ , output LLL( $\mathcal{L}, \lambda$ ).
  - if  $\text{rank}(\mathcal{L}) = K$  AND  $\ell = 1$ , return SVP( $\mathcal{L}$ ).

# Analysis: Key Lemmas

Lemma 1. All recursive calls satisfy

$$\min \{l, n-l\} \leq n-K+1.$$

All can be verified directly from local checks!

↳ Algorithm does not get "stuck"!

Lemma 2. The potential  $\Phi(n, \tau) := \tau + 20 \log(n-K+1)$  drops by at least 1 from parent to grandchild.

↳ poly(n) runtime (oracle calls).

Lemma 3. The guess  $f(n, l, \tau) := K^{\frac{l(n-l)}{2(K-1)}} \cdot \exp(n^3/2^\tau)$  satisfies the recurrence induced by 1.

↳ Achieve basis reduction tradeoff  $K^{\frac{l(n-l)}{2(K-1)}}$ .

Why not let the computer do it?

Duality: if  $\text{CONDITION}(n, \ell, \tau)$ , output  $\mathcal{L} \cap A(\mathcal{L}^*, n-\ell, C)^{\perp}$

Recursive step:  $\hat{\mathcal{L}} \leftarrow A(\mathcal{L}^*, \ell^*, C^*)$

Output  $A(\mathcal{L} \cap (\hat{\mathcal{L}})^{\perp}, \ell, C - C^*)$ .

Base cases:  $\tau=0$ , output  $\text{LLL}(\mathcal{L}, \lambda)$ ; if  $n = k$  AND  $\ell = 1$ , output  $\text{SVP}(\mathcal{L})$ .

# Computer-Aided Search

- Our DSP  $\rightarrow$  SVP involved tricky parameter choices.  
Why not let the computer do it?

Duality: if  $\text{CONDITION}(n, \ell, \tau)$ , output  $\underline{z} \cap A(\underline{z}^*, n-\ell, c)^{\perp}$

Recursive step:  $\hat{\underline{z}} \leftarrow A(\underline{z}^*, \ell^*, c^*)$

Output  $A(\underline{z} \cap (\hat{\underline{z}})^{\perp}, \ell, c - c^*)$ .

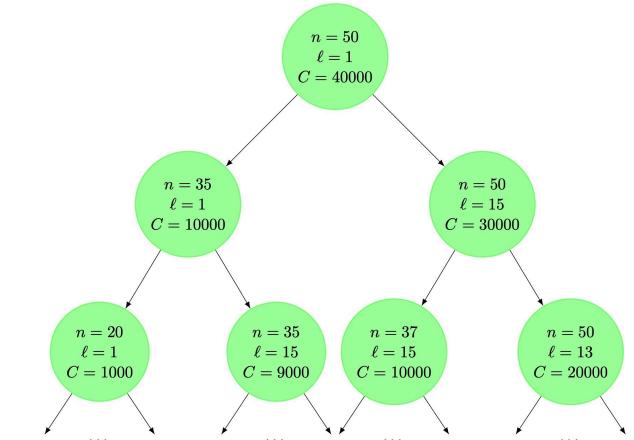

Base cases:  $\tau=0$ , output  $\text{LLL}(\underline{z}, \ell)$ ; if  $n=k$  AND  $\ell=1$ , output  $\text{SVP}(\underline{z})$ .

- Using dynamic programming, solve

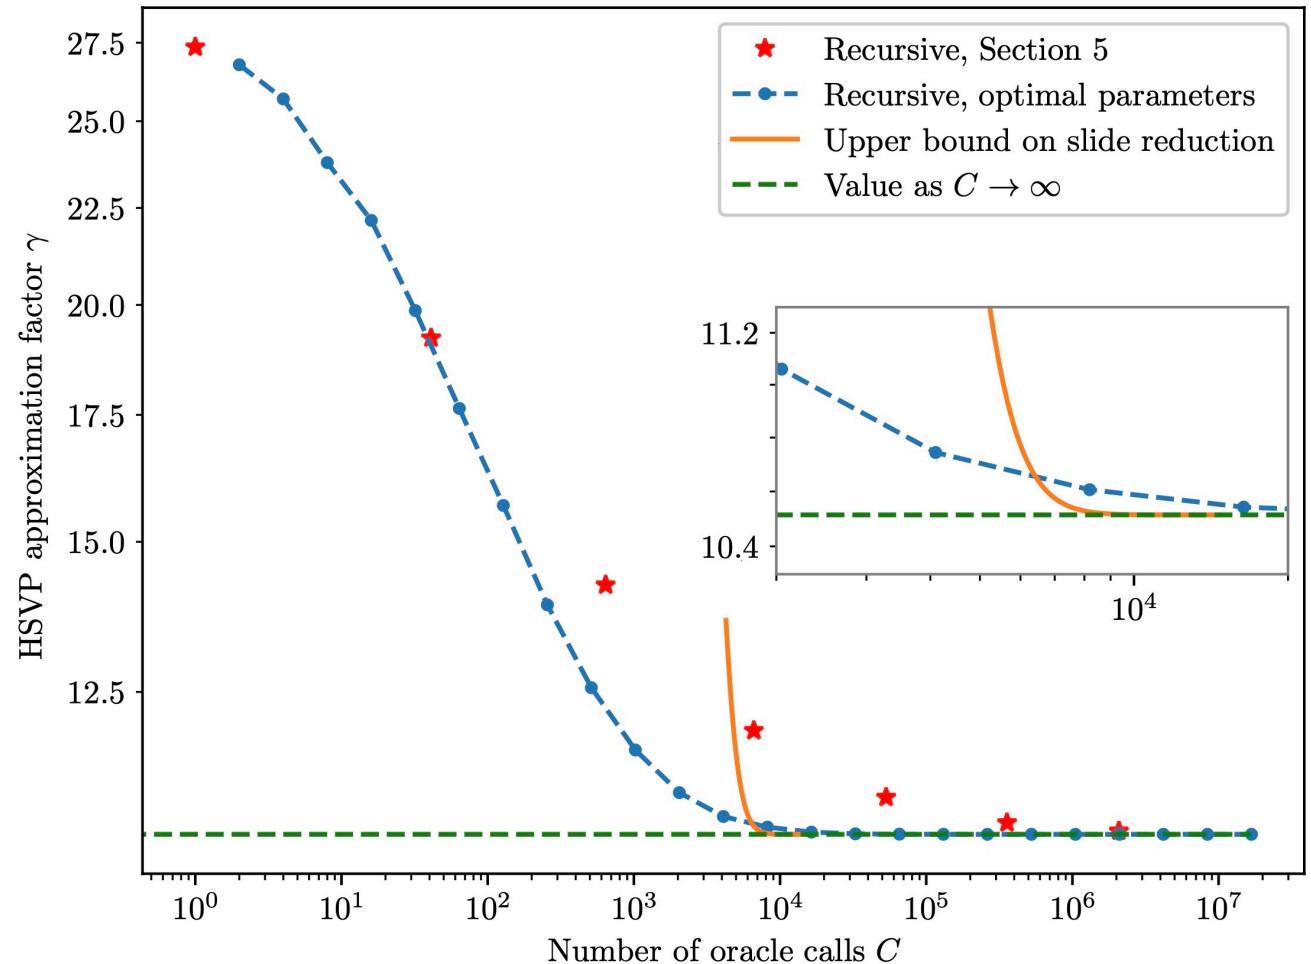

$$\gamma(n, \ell, c) := \min \left\{ \begin{array}{l} \gamma(n, n-\ell, c) \\ \min_{1 \leq \ell^* \leq n-k} \min_{c^* \leq c} \gamma(n-\ell^*, \ell, c - c^*) \gamma(n, \ell^*, c^*)^{\frac{\ell}{n-\ell^*}} \end{array} \right\}$$

# Results

- Optimal DP solution bounds rather massively improve on DSP → SVP guarantee.

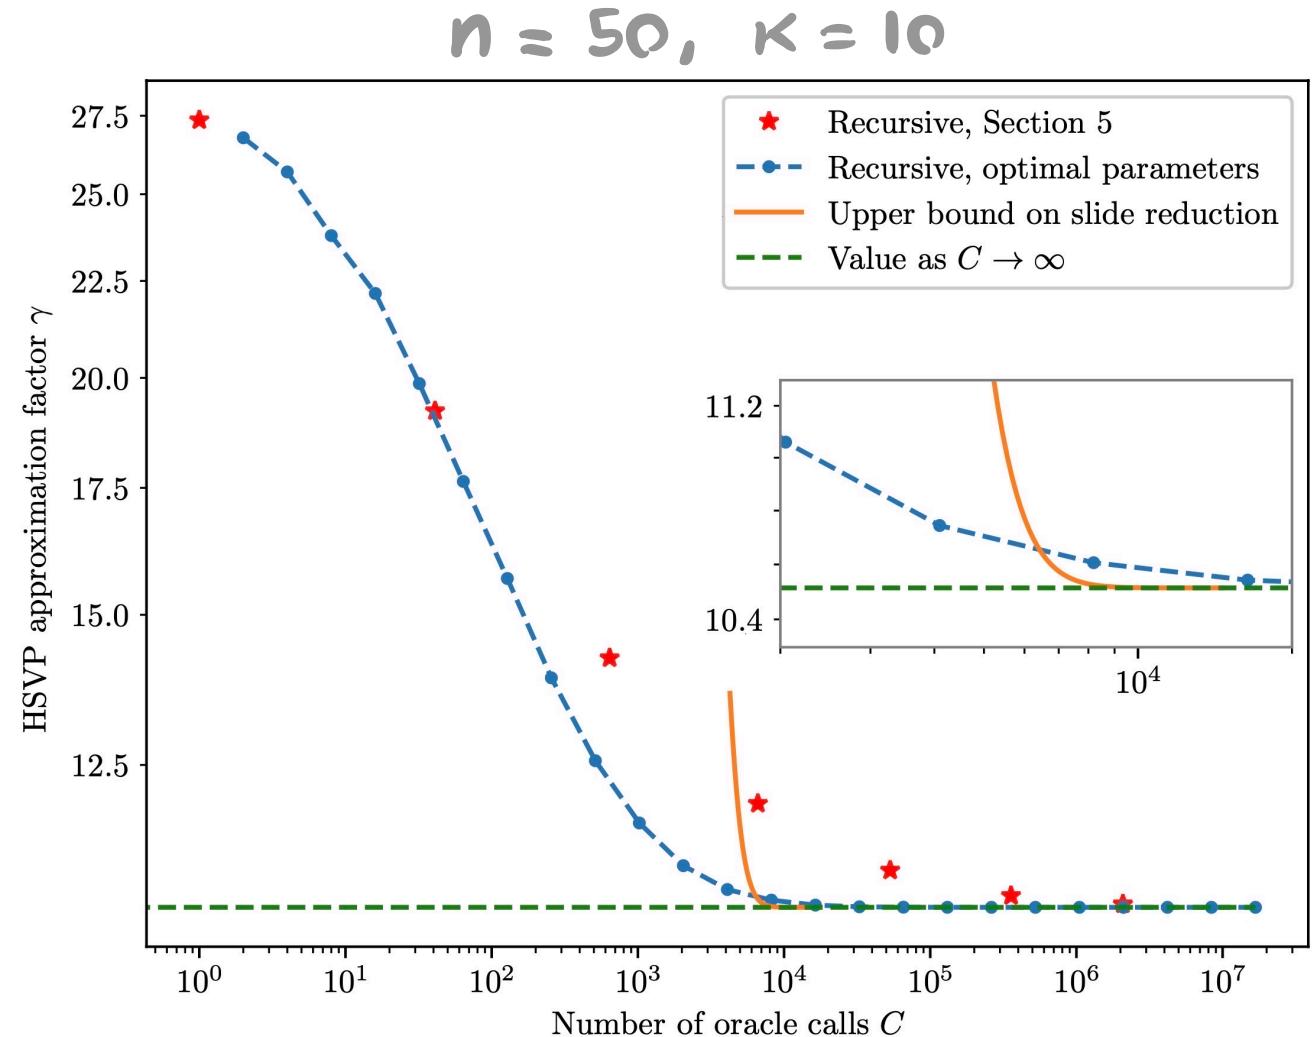

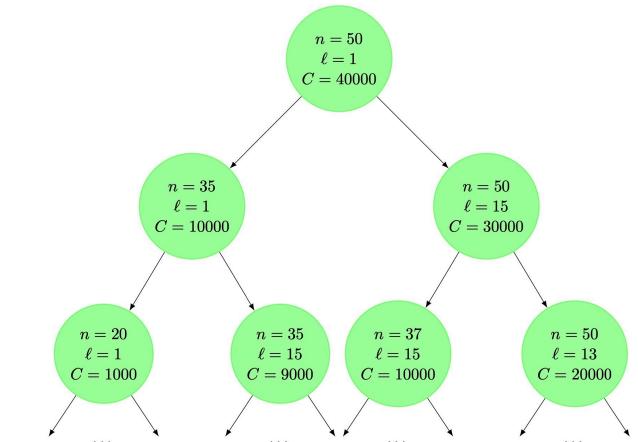

$n = 50, \kappa = 10$

# Results

- Optimal DP solution bounds rather massively improve on DSP  $\rightarrow$  SVP guarantee.

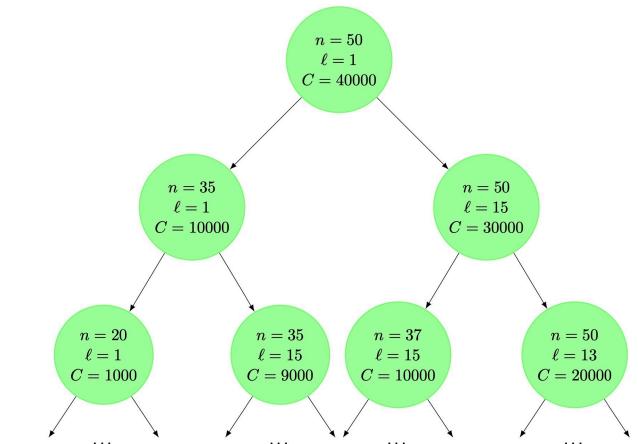

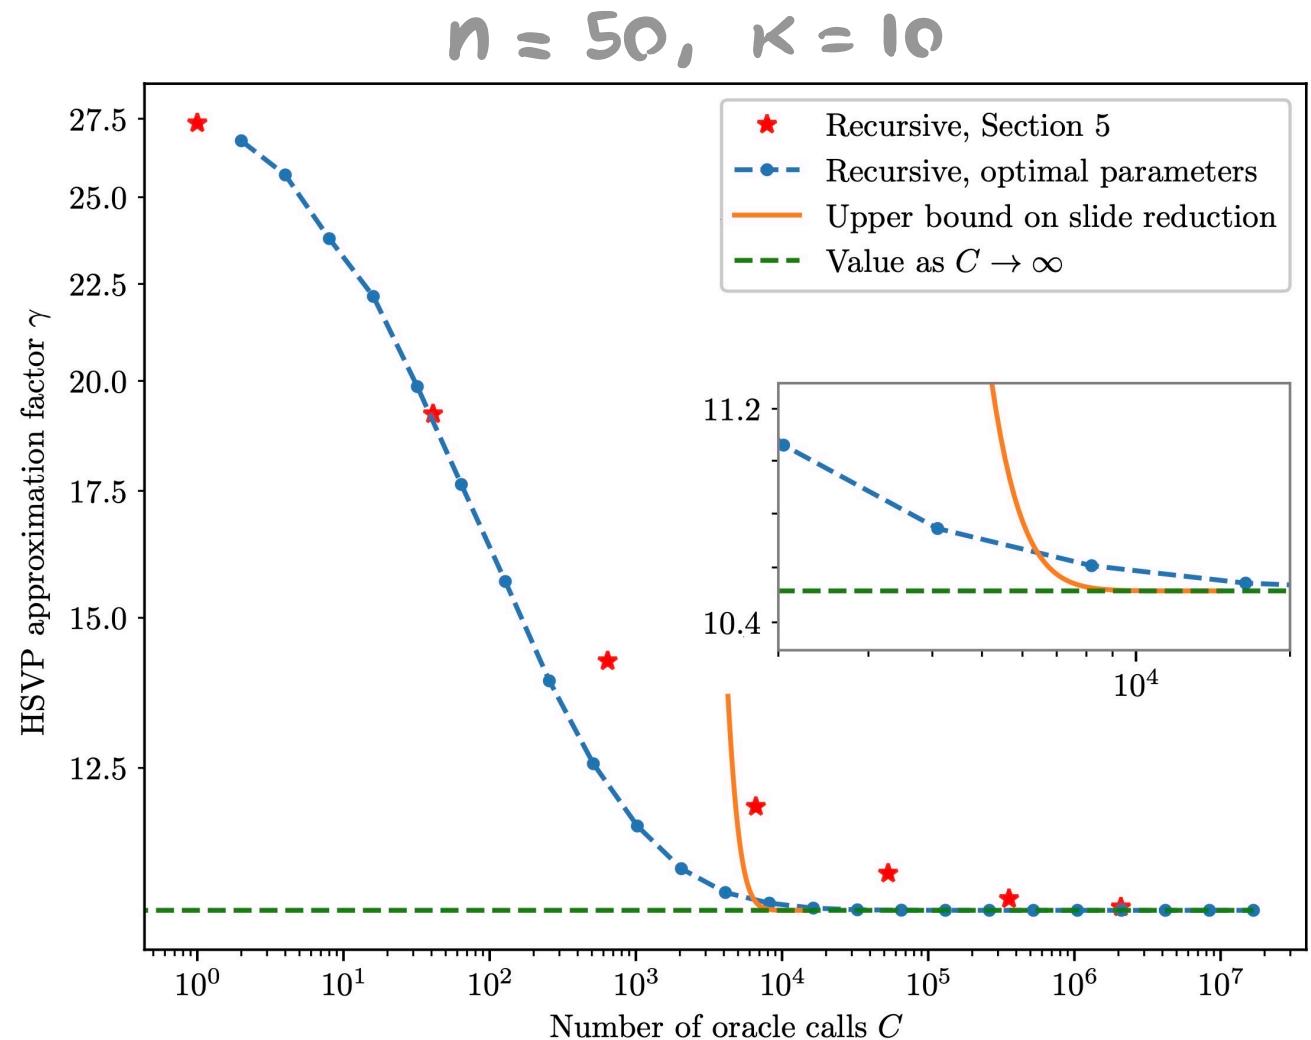

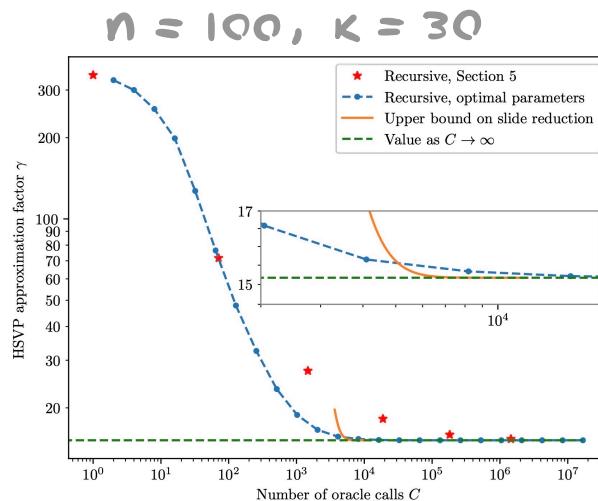

- Comparable to provable bounds on slide reduction.

# Results

- Optimal DP solution bounds rather massively improve on DSP  $\rightarrow$  SVP guarantee.

- Comparable to provable bounds on slide reduction.

# Mixing and Matching Oracles

- Rough estimate: solving SVP in dimension  $n$  takes time  $2^n$ .

Optional Base Case: For all  $T \geq 2^n$ ,

$$\gamma(n, 1, T) = \sqrt{n}.$$

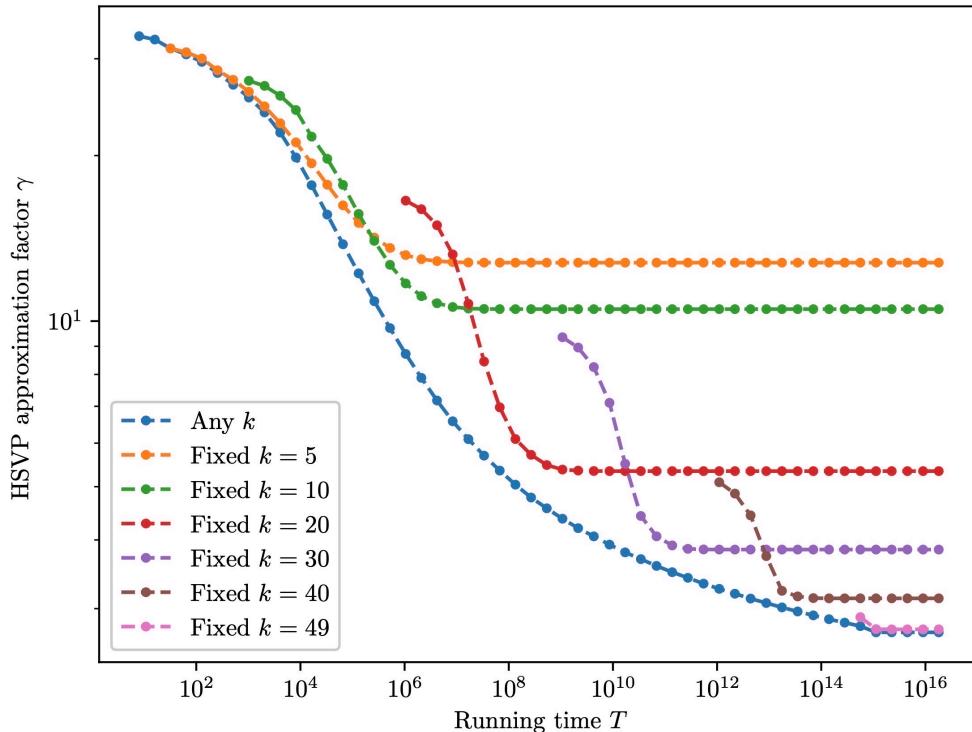

# Mixing and Matching Oracles

- Rough estimate: solving SVP in dimension  $n$  takes time  $2^n$ .

Optional Base Case: For all  $T \geq 2^n$ ,

$$\gamma(n, 1, T) = \sqrt{n}.$$

$n = 50, \kappa = 10$

- Rough estimate: solving SVP in dimension  $n$  takes time  $2^n$ .

Optional Base Case: For all  $T \geq 2^n$ ,

$$\gamma(n, 1, T) = \sqrt{n}.$$

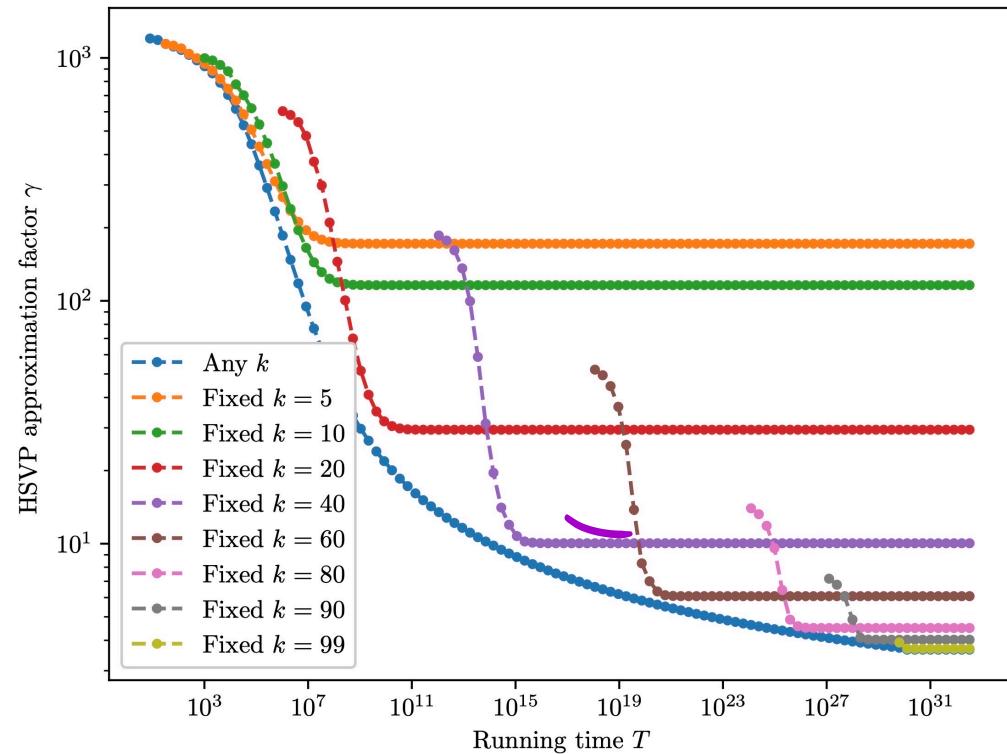

$n = 50, \kappa = 10$

HSVP approximation factor  $\gamma$

$n = 100, \kappa = 30$

HSVP approximation factor  $\gamma$

# Future Directions

- Explore the design space
  - Tuning parameters to exploit structure
  - Trees of higher arity?

# Future Directions

- Explore the design space
  - Tuning parameters to exploit structure
  - Trees of higher arity?
- Basis Reduction and Recursive Lattice Reduction
  - Is there a formal relationship?
  - Can recursive lattice reduction capture LLL?
  - Mix and match?

# Future Directions
